

Meet Arc.

The AI sales agent that lives inside your WhatsApp.

Arc answers every customer within moments, speaks like your best salesperson - in English, Sinhala or Tamil - captures every lead, studies each customer's business while chatting, sends signable quotations right into the conversation, and follows up until every deal has an answer. Around the clock, every day.

Hi, do you build websites for bakeries?

We do - quite a few food businesses actually. I'm Arc from ARC AI. What's your name?

Nimal. I run Nimal Bakery in Kandy, our site is nimalbakery.lk

Nice to meet you Nimal! Just had a quick look at the site - it scores 34/100 on Google's mobile speed test, so customers may be leaving before it even loads. When did you last update it?

A real capability document - everything described inside is live and working today, not a roadmap.

WHY THIS EXISTS

Your customers already live on WhatsApp. Your sales team doesn't.

In Sri Lanka, business happens on WhatsApp. Customers ask for prices at 11 pm, send voice notes while driving, and expect an answer now. Meanwhile inquiries sit unread overnight, staff forget to follow up, and nobody remembers what was promised to whom. Every one of those moments is a lost sale.

Arc fixes this. It is an AI salesperson installed on your official WhatsApp Business number - not a menu bot that says "press 1 for prices", but a conversational agent that texts like a sharp, friendly human, one short message at a time. It greets new customers, learns their names, understands what they need, researches their business while chatting, recommends the right package from your own price list, sends a signable quotation into the chat, and hands the conversation to your team the moment a human touch is needed. Every conversation, every detail, every promise lands automatically in a built-in CRM your whole team can see.

From "hi" to a signed agreement - hands-free. A customer can message your number, chat naturally, receive a personalised audit of their own website, agree on a package, sign a formal quotation on their phone, and receive the invoice with payment details - while your team simply watches it happen live in the inbox.

WHAT'S IN THIS DOCUMENT

The next pages break down everything Arc can do, in plain language: how it talks, what it can hear and see, how it fills your CRM, how it researches customers, how it sells and closes, how it follows up, the controls your team keeps, and how it improves itself every week.

What Arc can do

01 Talks like a person - because that is what sells

Nobody buys from a robot. Arc's entire conversational style is engineered to feel like a real salesperson texting from their phone.

- **Short, natural messages.** One to three sentences at a time, like real texting - never walls of text. It asks one question at a time and always ends with a clear next step, so conversations never stall.
 - **Speaks your customer's language.** Replies in English, Sinhala or Tamil - automatically, in whichever language the customer writes.
 - **Matches their energy.** Casual with casual customers, formal with formal ones. It compliments genuinely, jokes lightly, and never sounds like a call centre.
 - **Handles message bursts gracefully.** When a customer fires off five texts in a row, Arc waits for them to finish and sends one reply that covers everything - just like a person would.
 - **Instant acknowledgement.** Messages are marked read right away and the customer sees a typing indicator, so they know they have been heard even before the reply arrives.
 - **Available around the clock.** It answers at 11 pm on a Sunday exactly as well as at 10 am on a Tuesday. Customers get answers while your competitors sleep.
 - **Honest by design.** It never invents prices, discounts or delivery dates - it only quotes what is in your approved knowledge base. And if someone asks directly whether it is a bot, it answers honestly and lightly, and offers a teammate.
-

02 Hears voice notes. Sees photos. Reads payment slips.

WhatsApp conversations are not just text - and Arc keeps up with all of it.

- **Understands voice notes.** When a customer sends a voice message, Arc listens, understands it, and replies. Customers who prefer talking to typing are never left behind.
- **Replies with its own voice notes.** For voice-first customers, Arc can answer with a natural-sounding voice note of its own (a setting you switch on or off). A voice reply feels personal - and gets listened to.
- **Actually sees photos.** Send it a product photo, a logo, or a screenshot of a website and Arc recognises what it is looking at and responds to the content - it never says "I can't view images".
- **Reads bank payment slips.** When a customer sends a transfer slip, Arc reads the amount, bank, date and reference number, thanks the customer warmly, and immediately creates an urgent verification task for your team - matched against the exact installment that is due. Importantly, Arc never confirms money on its own: a human always verifies the payment before anything is marked paid.
- **Never forgets what it was sent.** Photos and documents stay in Arc's memory for the whole relationship - even weeks later, in a long conversation, it still remembers the logo or slip the customer shared.

03 Fills your CRM by itself - no data entry, ever

Most CRMs fail because nobody fills them in. Arc's CRM fills itself while it chats.

- **Every contact becomes a lead - automatically.** The moment a customer shares their name, Arc creates a client profile and a lead card in your sales pipeline, in exactly the stage you choose. Company, email, city and what they want are captured as they naturally come up in conversation.
- **Every detail is logged.** Requirements, budget hints, objections and promises are written onto the lead as notes - your team opens the CRM and instantly knows the full story.
- **Leads are scored hot, warm or cold.** When buying signals appear - asking prices, timelines, "can you do this?" - Arc marks the lead hot and records the estimated deal value, so your pipeline always reflects reality.
- **Your team is alerted at the right moments.** New lead captured, hot lead wants a call, quote sent, payment slip received - the whole team gets an instant notification on their phones.
- **A complete audit trail.** Every single action Arc takes is logged with a timestamp in an Agent Activity feed - full transparency into what the AI did, for which customer, and why.

04 Does its homework on every customer - while chatting

This is where customers start saying "wow". Arc researches the person it is talking to, in real time, and uses what it learns to sell.

- **Instant website check-up.** The moment a customer shares their website address, Arc examines it live: mobile-friendliness, security, Google's real speed score, search-engine basics and how up to date it looks. Seconds later it mentions the one or two issues that matter most - casually, like an expert who just browsed their site, not like a report.
- **Deep research runs silently in the background.** While the chat continues, Arc studies the customer's business - what they sell, their reviews, their reputation, their competitors. It never announces this. A few minutes later it simply knows things, and drops them naturally into conversation like a consultant who has worked in their industry for years.
- **The follow-up that feels like magic.** When the research finishes, Arc sends one unprompted message that casually proves it understands their business and connects that insight to how you can help - the moment many customers decide these people are serious.

05 The Showcase - show, don't tell

Arc's signature closing move. Instead of describing what you could do for the customer, it shows them - with their own website.

- **A personalised page, built automatically.** Arc assembles a private page for the customer: their website's real audit scores alongside an AI-generated redesign concept of their own homepage - a before-and-after of their actual business.
- **Delivered into the chat as an image.** It lands in the conversation as a picture message with a link - instantly shareable with a business partner or spouse (which is exactly where buying decisions

happen).

- **A professional audit report, included.** A downloadable report of the website's health comes with it, giving the customer something concrete to keep - with your branding and booking link on it.
- **Perfectly timed.** Arc holds this card until the audit has run and the customer is genuinely engaged - then teases it: "actually, give me a few minutes - I want to show you something." One showcase per customer, never spammed.

06 Sells from your playbook - and closes with a signature

Arc does not just chat - it moves deals forward using your packages, your prices and your rules, all the way to a signed agreement.

- **Your prices are the law.** Packages, prices, inclusions and delivery times come from a knowledge base you control. Arc presents the full picture - price, what's included, timeline - and never invents a number. Anything it doesn't know: "let me get the team to confirm that."
- **Sells like a professional.** It matches packages to the customer's stated budget, then shows the next tier up with the two or three extra benefits that matter for their business - the way a great salesperson anchors value. It frames everything around the customer's goals, never a feature dump.
- **Books meetings.** When a call makes sense, Arc shares your live booking page so the customer picks a slot themselves - no back-and-forth.
- **Drafts full proposals.** Once it has gathered requirements, Arc writes a complete, priced proposal document and tasks your team to review and send it.
- **Sends signable quotations into the chat.** The moment a customer agrees on a package, Arc creates a formal quotation - numbered, itemised, with validity date and deposit terms - and delivers an e-signature link right into the conversation. The customer reviews and signs on their phone, in the same chat where they said yes.
- **Controlled discount authority.** By default Arc can give no discount at all. You may grant it a ceiling (say, up to 5%) - it will use it at most once per deal, only on a genuine price objection, and the system enforces the cap automatically.
- **Signature closes the deal - automatically.** The instant the customer signs, the invoice and payment details are generated and sent, a deposit-collection task is created for your team, and the lead is updated - the whole closing ritual happens with zero manual admin.
- **It knows when the quote is being read.** Arc can tell when a customer opens their quotation and treats it as a hot moment - referencing it naturally and inviting questions at exactly the right time.

07 Follows up until every deal has an answer

Most deals are not lost - they are forgotten. Arc never forgets.

- **A three-touch follow-up rhythm.** If a customer goes quiet, Arc re-engages on its own: a light nudge after about two days, a fresh angle about three days later, and - if there is still silence - a warm, zero-pressure goodbye about five days after that. Never pushy, never "just following up", always referencing something real about their business.

- **The voice-note nudge.** The second follow-up can arrive as a spoken voice note - from "a real person", it is nearly impossible to ignore.
 - **Deal-aware follow-ups.** If a signed-ready quotation is sitting unopened - or was opened minutes ago - Arc knows, and shapes the follow-up around it.
 - **Stops the instant they reply.** Any response from the customer cancels all scheduled follow-ups immediately. Nobody ever gets chased after answering.
 - **Respects sleep.** Quiet hours (you set the window, e.g. 9 pm to 9 am) hold all Arc-initiated nudges until morning. Incoming customer messages are still answered 24/7 - quiet hours only ever delay Arc's own reminders.
 - **Plays by WhatsApp's rules.** Outside WhatsApp's 24-hour messaging window, Arc switches to your pre-approved template message - or, if none is set, hands the follow-up to a human with a task. Your number's standing with WhatsApp stays protected.
 - **Honest pipeline hygiene.** After the final goodbye, the lead is marked cold with the reason recorded - so your pipeline never fills with zombie deals.
-

08 Your team stays in charge - always

Arc is powerful because it is controllable. Every autonomy has an off switch, and a human can take over at any second.

- **Instant human handoff.** If the customer asks for a person, gets frustrated, or raises anything sensitive, Arc pauses itself for that chat, flags it, and alerts the whole team to take over.
 - **A shared team inbox.** Every conversation lives in a WhatsApp inbox inside the CRM - your team can read along, jump in manually, and pause or resume the AI per conversation with a single switch.
 - **Keyword rules that fire instantly.** Define your own automatic replies: a customer who types "price list" can get a canned response, be tagged, trigger an automation, or be routed straight to a human - before the AI even wakes up.
 - **"Stop" means stop - in three languages.** Arc recognises opt-out messages in English, Sinhala and Tamil. One polite goodbye, then all automated messaging to that person stops permanently, and the lead is closed - protecting both the relationship and your WhatsApp number's health.
 - **Permission switches for every ability.** Each of Arc's fourteen abilities - creating leads, running research, sending quotes, giving discounts and so on - has its own on/off checkbox. You decide exactly how much autonomy it gets, and you can change it any time.
 - **Your agent, your personality.** Its name, greeting, tone-of-voice instructions and knowledge base are all yours to edit - it represents your business, the way you want.
-

09 Gets measurably better every week

Arc is the only salesperson you will ever meet that reviews every one of its own conversations - and actually acts on it.

- **Weekly self-coaching.** Once a week, Arc studies its own chats: which messages got replies, where customers went quiet, which deals were won and lost, and what it said right before each outcome.
- **Lessons applied automatically.** It distils this into short coaching notes - e.g. "shorter first replies get more responses" - and applies them to every conversation the following week. Your sales agent on month three is sharper than it was on day one, with no retraining project and no extra cost.

THE COCKPIT

What your team sees

Everything Arc does is visible in one place inside the CRM - four tabs, zero mystery:

Inbox	Every WhatsApp conversation with live unread counts, full history, manual reply box, per-chat AI pause, and an "Add to CRM" button.
AI Agent	The control room: agent name, greeting, personality, knowledge base (services and prices), lead pipeline, voice replies, follow-ups, quiet hours, discount authority and the fourteen permission switches.
Keywords	Your instant-reply rules - keyword, reply text, tagging, handoff and automation triggers, with hit counters showing how often each fires.
Agent Activity	The audit trail: every action Arc took, for which contact, when, and the result - so you can always answer "why did it do that?"

ONE CONNECTED SYSTEM

Not a chatbot bolted on - a salesperson wired in

Arc is built into a complete business system, so a WhatsApp chat flows naturally into everything else: the sales pipeline it files leads into, the meeting booking pages it shares, the proposals it drafts, the quotations customers e-sign, the invoices and payment tracking that fire when they do, and the automation engine that ties it all together. It even understands cold outreach: when your team messaged a prospect first, Arc knows the history and opens the conversation accordingly - no awkward "how can I help you today?" to someone you contacted.

Compliance and courtesy, built in. Arc runs on the official WhatsApp Business platform, respects the 24-hour messaging window, honours opt-outs in three languages instantly, defers night-time nudges to the morning, and leaves payment confirmation to humans. Automation that protects your reputation instead of risking it.

GETTING STARTED

ARC AI sets everything up for you

You do not need to be technical - you will never see a line of code. Getting Arc onto your number is a done-for-you service:

- | | |
|-------------------|---|
| 1. Connect | We install Arc on your official WhatsApp Business number. |
| 2. Teach | We load your services, packages, prices and FAQs into the knowledge base - Arc's single source of truth. |
| 3. Shape | We set the agent's name, greeting and personality to match your brand, in English, Sinhala and Tamil. |
| 4. Wire | We map leads into your pipeline, connect booking pages, quotations and invoicing, and set quiet hours and discount authority. |
| 5. Control | Together we choose which of the fourteen abilities to switch on - start conservative, expand as trust grows. |
| 6. Go live | Your team learns the inbox in one short session. From that moment, every customer gets an instant, expert answer. |

Want Arc on your WhatsApp number?
